

**GUIDE**

# CREATE A DUMMY DEVICE

Would you like to create a setup where you can easily control multiple devices, send emails or SMS with a manual trigger? If this is the case you can create a dummy device and use events to control whatever you want with a single click.

**LET'S GET STARTED!**

**YOU WILL NEED**

 **TELLDUS LIVE!**

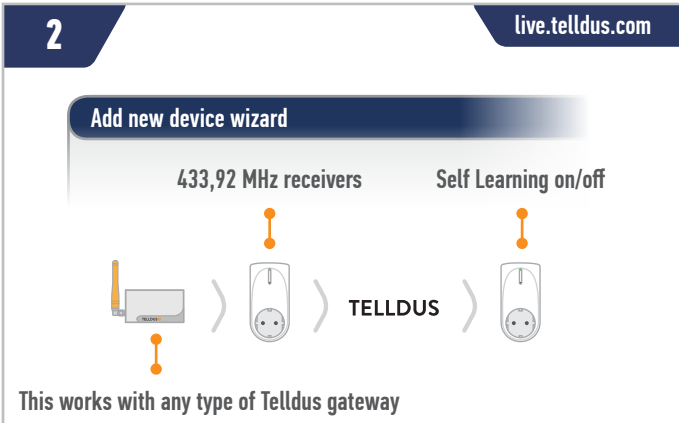

**1** live.telldus.com

**2** live.telldus.com

**Add new device wizard**

433,92 MHz receivers      Self Learning on/off

This works with any type of Telldus gateway

**3** live.telldus.com

**Add new device wizard**

Name:

**Next**

**4** live.telldus.com

~~Learn~~      This is not an actual device and only used for controlling other actions, so skip the Learn step.

**Done**

**Tip!** When the dummy device is created you can use events to make it control what you want. Examples of how to use dummy devices can be found in the guide **"Make a device dim to a specific level"** or **"Create Macros/Scenes"**. You can also use a dummy device as an indicator, for example when a motion detector triggers, if you don't want to use an actual connected device.
